10-POINT ROLL CAGE CONV.
1994-98 MUSTANG HDTP
P/N C3328

This style cage kit is designed for use with the factory dash to remain in place and the front cage supports to pass through the dash. This design was developed for maximum interior room and to conform as tightly as possible to the body structure of late model, aerodynamic body styles.

PARTS LIST

(1) Cage Leg (Left)          (1) Cage Leg (Right)
(1) Windshield Crossbar

INSTALLATION INSTRUCTIONS (MUSTANG)

1. Begin by jacking and leveling the car using jacking points, rocker panel pinch welds or the front or rear frame rails.
2. Jackstands should be placed at points on the uni-body frame that are reinforced from the factory.
3. Ensure the car is level from front to rear and left to right. Place the vehicle on (4) jackstands, (2) just behind the front wheels and (2) just in front of the rear wheels. Use shims placed between the jackstands and frame to level the chassis. Any twist that exists from improper leveling, will remain after the roll cage is installed.

2. Remove all seats, consoles and carpeting.
   a. The windows and door/interior panels should be covered and protected from grinding and welding sparks.

(3) a The dash cover will have to be modified and holes will need to be made just forward of the side window defrost vents. A hole slightly larger than the roll bar is necessary.
b Using the supplied template, cut out the hole in the template for the roll bar tube. Hold the template against the windshield post trim and the edge of the dash that meets the door and tape it in place.
c Mark the dash and cut the hole using a rotary file or a hole saw.
d Repeat for the other side. See Fig 2

(4) a In order to install the Cage Legs through the dash, the entire dash will have to be unbolted. Rotate the dash rearward until the dash is far enough back that the side leg can be slid through the hole made in the dash.
   **Note Very Important! BOTH CAGE LEGS MUST BE SLID THROUGH THE DASH AND INTO POSITION AT THE SAME TIME!**
b Both the dash and the cage leg will be rotated back again until both parts are in position.

(5) a To install the Cage Legs (left and right), gradual trimming of the floor end of the bar will be necessary until the proper height is achieved. Remember to account for the mounting plates when cutting.
b The main hoop end of the left and right Cage Legs will require gradual trimming and notching for proper fit.
c While holding either Cage Leg against the Main Hoop, carefully mark the Cage Leg for trimming. Leave 1” extra for notching. It may take 4 or 5 tries to get it right, keep trimming 1/8” at a time until the Cage Leg slips into position (hugging the roof line as close as possible). See Fig 3
(8) a Prepare the front floor area for welding of the mounting plates. Mark the floor area to be prepared for installation of the 6” X 6” X 1/8” thick mounting plates. The mounting area of the floor should be prepared in the same way the rear mounting points were done.
   b The mounting plates will need to be bent or cut and formed into a shape that conforms to the floor pan and rocker panel.
   c Once the plates are fit, tack them in position.
   d The cage side hoops can be slid into position for tack welding. Be sure to fit check with the driver seated in position. Tack weld in place.

(9) a The Windshield Bar will be installed next. The bar will require gradual trimming and notching. The windshield bar is designed to fit at the top of the windshield between the rear view mirror and the headliner panel.
   b Measure the width of the roll cage across the vehicle just in front of the head liner. The measurement should be from inside of the left Cage Leg to the inside of the right Cage Leg.
   c Mark the target location on each Cage Leg. Trim the windshield bar allowing an extra 1” inch at each end for notching. Notch the bar an 1/8” at a time until the bar fits properly. See FIG 4
   d Tack into place.

Note: at this time you should have already covered all window glass and protected anything that could be damaged by welding sparks.

FIG 4

Note: you will need to follow the directions included with your C3310 strut kit to complete the installation of this kit.
